TITLE: Computation of Thermodynamic Functions of Diatomic Ideal
              Gases, the Molecules of Which Are in the $^3\Pi$ Electron State
              (Vychisleniye termodinamicheskikh funktsiy dvukhatomnykh
              ideal'nykh gazov, molekuly kotorykh nakhodyatsya v $^3\Pi$ elek-
              tronnom sostoyanii)

ABSTRACT: A computation method was worked out, which is more accurate
              than the one suggested by Gordon (Ref 1), and which serves
              for the computation of thermodynamic functions of diatomic
              ideal gases, the molecules of which are in the $^3\Pi$ electron
              state (regular and inverse), with an arbitrary bond type
              according to Hund. The two cases of an a and b bond accord-
              ing to Hund (of high and low temperature) are considered,
              and it is stated inter al   that a correction according to
              Budó (Ref 2) into the equation (1) by Hill and van Vleck
              (Ref 3) leads to a wrong derivation; hence, this correction

Card 1/2

SOV/76-33-6-20/44

Computation of Thermodynamic Functions of Diatomic Ideal Gases, the
Molecules of Which Are in the $^3\Pi$ Electron State

must be rectified. Some new and more simple computation equa-
tions (than those by Gordon) are derived (45) - (52), (9),
(34) - (36) and on the strength of the example of the mole-
cules C_2 and TiO the values of free energy and entropy are

computed; they are furthermore computed according to two
other methods and compared (Table 2). There are 2 tables
and 10 references, 3 of which are Soviet.

TITLE: Statistical methods of calculating thermodynamic functions of
             ideal gases. Communication IV. Approximation methods for
             calculating the statistical sum of the vibrational and
             rotational levels of diatomic molecules

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 12, 1961, 62, abstract
             126409 (Sb. tr. Gos. in-ta prikl. khimii, 1960, vyp. 46,
             3-14.)

TEXT: In continuation of a paper published earlier (Communication III,
RZhKhim, 1960, No. 12, 46007) the authors describe approximation methods
for calculating statistical sums of the vibrational and rotational levels
of the energy of the molecules in $^1\Sigma$-, $^2\Sigma$-, $^3\Sigma$-, $^2\Pi$- and $^3\Pi$-states. The
calculations were made by the method of A. R. Gordon, C. Barnes ("J. Chem.
Phys.", 1933, 1, 297) for all given states, by the method of L. S. Kassel
("J. Chem. Phys.", 1933, 1, 576; "Chem. Rev.", 1936, 18, 277) for the
$^1\Sigma$ electron state, and by the method of D. Mayer, M. Geppert-Mayer

(Statistische Mechanik. IL, 1952) for the $^1\Sigma$ state. The authors obtained calculation formulas. It is emphasized that the generalization of the methods of Kassel and Mayer - Geppert-Mayer for other electron states is analogous to the mentioned calculations of these states made by the method of Gordon and Barnes. TITLE: Determination of effective values of vibration constants of diatomic molecules for calculating thermodynamic functions of ideal gases at high temperatures

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 11, 1961, 10, abstract 11 B 68 (Sb. tr. Gos. in-ta prikl. khimii, 1960, vyp. 46, 29 - 42)

TEXT: The authors describe a method of calculating the coefficient of the extrapolation equation for the energy of high vibrational levels of a diatomic molecule conjugated with the equation for the energy of experimentally determined lower levels, which equation corresponds to the demand for convergence of the vibrational levels to the limit of dissociation.   They also suggested a method of approximation of the energy of vibrational levels by means of a power function of the quantum number ν which is based on the use of the method of least squares by introducing statistical weights for each level. The values of effective

Determination of...

24813
S/081/61/000/011/002/040
B105/B203

vibration constants obtained by the method suggested depend on temperature. It is assumed to be convenient to utilize the thus found approximation equations for the energy of vibrational levels when making a great number of calculations of thermodynamic functions in the given interval of temperatures, or for estimating the calculation errors. Examples are given for calculations of H_2 and HF. [Abstracter's note: Complete translation.]

TITLE: Determination of effective values of oscillation constants of diatomic molecules for calculating thermodynamic functions of perfect gases at high temperatures

TEXT: The authors developed a method of approximate calculation of higher oscillation levels based on the known values of lower levels and experimentally found value of the molecule dissociation energy. They propose a method of determining "effective constants" which assure the greatest precision of calculating thermodynamic functions at the given numbers of constants. "Effective constants" proved to be dependent on temperature. The method is exemplified by calculating molecules of H_2 and HF.

PURPOSE: This reference book may be used in scientific-research and
    experimental-design work in institutes, design offices, and
    schools of higher education, as well as for training specialists
    in chemical thermodynamics and thermal physics.

COVERAGE: Volume 1 of this work deals with methods for calculating
    thermodynamic properties and with the selection of constants re-
    quired for the calculations. Volume 2 contains tables of thermo-
    dynamic properties (reduced thermodynamic potential, entropy,
    enthalpy, and the logarithm of the dissociation or ionization
    constants of equilibrium) compiled, where data were lacking, on the
    basis of published and unpublished material from a number of Soviet
    research institutes. Thermodynamic properties for the ideal gas

Card 2/9 3

Thermodynamic Properties (Cont.)   SOV/6260

state are presented in table form for 335 gases, 44 liquids, and 45 solids compounded from 33 chemical elements and their isotopes, viz.: H, D, T, He, Li, Be, B, C, N, O, F, Ne, Na, Mg, Al, Si, P, S, Cl, Ar, K, Ca, Br, Kr, Re, Sr, Zr, I, Xe, Cs, Ba, Hg, and Pb. Thermodynamic properties are given for the following 22 gases in the range from room temperature to 20,000°K: H, H$^+$, H$^-$, O, O$^+$, H$_2$, O$_2^+$, O$_2$, OH, OH$^+$, H$_2$O, N, N$^+$, N$_2$, N$_2^+$, NO, NO$^+$, C, C$^+$, CO, CO$^+$, and e$^-$; for the 14 least stable gases up to 4000°K; and for the remaining 299 gases up to 6000°K. Virial coefficients for 34 gases are also given up to 6000°K.

Title   : Fast Method of Determination of Potassium Oxide
            in Glass by Radioactivity.

Orig Pub: Zavod. laboratotiya, 1956, 22, No. 11, 1293.

Abstract: The determination of potassium oxide in glass was
           carried out using the β radiation of the natural
           radioactive isotope K^{40}. The activity was meas-
           ured with an installation of the type B with a
           AS-2 counter. In order to eliminate adjustments
           for self-absorption, the thickness of the speci-
           men surrounding the counter must be $\geqslant 0.4$ g/cm^2.
           The error of the determination of K_2O in glass

TITLE: Heating Stove for Glass Parts of Electronic Fluorescent Tubes (Nagrevatel'naya pech' dlya steklyannykh detaley elektronno-luchevykh trubok)

PERIODICAL: Steklo i keramika, 1958, Nr 1o, pp 44-45 (USSR)

ABSTRACT: The authors of this article constructed some gas stoves for these parts at the Moskovskiy elektrolampovyy zavod (Moscow Incandescent Bulb Factory). The stoves were built for the heating of cones and shades prior to their welding. Such a stove (Fig 1) has two muffle channels, a lower and an upper one. The heating surfaces of the muffle channels are produced of carborundum plates of the dimensions 303 x 343 mm. The construction makes it possible to heat the parts to be welded sufficiently quickly, and also to carry out repair work of the muffle without putting the stove to pieces. The waste gases from the lower muffle are directed into the upper one; they heat the latter and then are sucked off by a fan. To improve the temperature control the muffle channels are separated into 5 individual sections by walls.
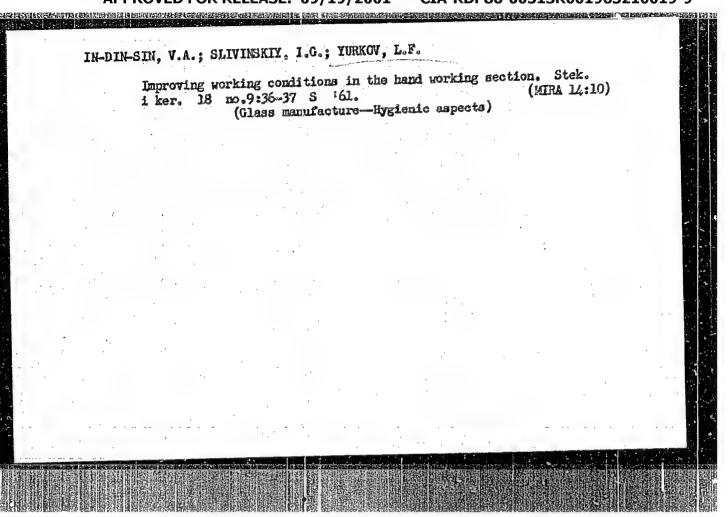

Card 1/2

SOV/72-58-1o-14/18

Heating Stove for Glass Parts of Electronic Fluorescent Tubes

The parts to be heated move continuously in the operation cham-
ber of the stove on a conveyer belt. The heating cycle may
be adjusted within 10 to 30 minutes at a length of the
operation chamber of the stove of 10 m; this is done by con-
trolling the velocity of the conveyer belt. The stove tem-
perature conditions are controlled by means of thermo-
couples. From figure 2 the course of the temperature in the
stove may be seen. This simple construction makes it pos-
sible to the glass factories to produce them by themselves.
There are 2 figures.

TITLE: Isobar for a real gas

SOURCE: IVUZ. Fizika, no. 4, 1966, 169-171

TOPIC TAGS: isobar, real gas

ABSTRACT: A family of isobars is constructed for carbon dioxide gas, using van der Waals corrections. The typical isobar exhibits a region of two-phase states similar to that of the van der Waals isotherm. It is shown that critical values of P_k, V_k, and T can be computed from the isobars.
    At 10 atm the volume of gas decreases linearly with temperature until a reversal occurs, similar to that of the van der Waals isotherm. In the reversal region the system is in a two-phase state: one consisting of super-cooled vapor, the other superheated liquid.
    With increasing pressure the reversal of the curve becomes smoother, until it finally disappears at the critical pressure of 100 atm. A comparison is made of the variation in pressure with decreasing temperature at constant volume. Orig. art. has: 2 figures and 2 formulas. [JPRS: 39,040]

YURKOV, V.A.

The change of electrical conductivity of Sb_2S_3 and V_2O_4 upon melting. V. A. Yurkov (State Univ., Saratov). *Izv. Acad.* _____ . — The elec. cond. σ and thermoelec. power were measured for Sb_2S_3 (m. 540°) from room temp. to 620° and for V_2O_4 (m. 655°) up to 730°. Sb_2S_3 was prepd. by heating Sb and S in glass ampuls evacuated to 10^{-4} mm. of Hg. Sb_2S_3 and Sb are immiscible liquids. The product was further heated in vacuum to remove excess S. 10–15 g. was then placed in ampuls with 4 Mo wires projecting inward. The ampuls were evacuated, sealed, and heated in a furnace to 620–30°. The ____ _____ through the m.p. several times. The solid was more dense than the liquid. At the m.p. σ was approx. 4 times greater for the liquid than or the solid (e.g. 1.36×10^{-7} vs. 0.35×10^{-7} ohm.$^{-1}$ cm.$^{-1}$). The plot of ln σ vs. $1/T$ (250 to 620°) showed 2 straight lines with $E = 0.9$ e.v. for the solid and 0.6 e.v. for the liquid; E is the energy required to liberate charge carriers. A 5–6 degree temp. gradient was used to det. thermoelec. power. The solid was a p-type semiconductor; the liquid was indeterminate. The addn. of S in the amts. of 0.2, 0.6, 1, and 5 wt. %, raised the ln σ vs. $1/T$ curve of the solid close to that of the liquid. The 5-wt.-% soln. showed a neg. temp. coeff. in the fused region. Cond. of p type was noted only below 1% S in the liquid. V_2O_4 was prepd. by thermal decompn. of $(NH_4)_2V_2O_7$ and sealed in glass ampuls with Pt electrodes. σ was measured in the range 300–730°. Up to 660°, σ was 0.1 to 0.13 e.v. (n-type cond.). From 660° to 670°, σ dropped sharply, e.g. $\sigma_{660} = 37.9 \times 10^{-2}$, while $\sigma_{670} = 4.55 \times 10^{-4}$ ohm.$^{-1}$ cm.$^{-1}$ In the liquid state, V_2O_4 was a p-type conductor. From room temp. to 660°, the vol. of V_2O_4 increased by 28 $\pm$ 2%, as indicated by a calibrated ampul. Dilatometric measurement on small cylinders showed that V_2O_4 contracts from room temp. to 200° and expands from 200 to 500°. Partial melting vitiated data above 500°. The opposite changes in σ upon fusion of ____ ____ with are attributed largely to opposite vol. changes ___ _____ of one conductors ___ to the ___ ___ ___ ___ ___ of barriers as a result of the change ___ ___ ___ ___ ___

Properties of Alloys ·

Some Physical Properties of Pb-Sb Alloys. V. A. Yurkov
(*Doklady Akad. Nauk S.S.S.R.*, 1953, 91, (4), 891-893).—[In Russian]. After discussing opposing views on the nature of eutectics (chem. compounds or mech. mixtures), Yu. gives graphs showing the variation of the coeff. of linear expansion (δ), density (d), and temp. coeff. of elect. resistance at $10°–100°$ C. (γ) with compn. for Pb–Sb alloys contg. 0–100% Sb. The alloys were prepared by melting in an evacuated ampoule and cast as ingots 45–50 mm. long $\times$ 5–6 mm. dia.; the specimens were not analysed. δ was measured in a quartz dilatometer, temp. fluctuations being $\pm1°–2°$; changes in length of 4–5 μ could be recorded. d was measured with a pyknometer. Changes in δ and d followed the additive law, except near the Pb ordinate, where the change was more rapid, owing to the solubility of Sb in Pb. Yu. also determined the variation with alloy compn. of the thermo-e.m.f. (α) produced by an assembly consisting of the alloy between 2 Cu blocks at $0°$ and $100°$ C., resp.; the results are discussed in terms of the theory of semi-conductors. The sign of α changes at $\sim20\%$ Pb; the ratio (valency electrons of Pb/valency electrons of Sb) $\cong$ wt. content of Pb in alloy for which $\alpha = 0$.—O. V. E. T.

The Influence of Cobalt on the Diffusion of Carbon in Iron-Carbon Alloys. V. A. Yurkov and M. A. Krishtal. (*Doklady Akademii Nauk S.S.S.R.*, 1953, 92, (6), 1171–1173). [In Russian]. The diffusion coefficients of carbon in iron containing 4% carbon with additions of 1, 3, 4, and 5% of cobalt were determined at 950°, 990°, 1020°, and 1050° C. The coefficient of diffusion of carbon was calculated from the velocity of growth of the austenite layer during decarburization with hydrogen at a given temperature. The curve for the dependence of the coefficient on cobalt content had two troughs at 1 and 4% Co. The authors also investigated the electrolytic potential difference between Armco iron and Fe–C–Co alloys using as an electrolyte 0·01M H_2SO_4. The plot of potential difference against cobalt content also had low points at 1 and 4% Co.—v. o.

Electrode potentials of three component alloys forming a chemical compound. V. A. Yurkov and M. A. Krishtal Izvest Sibir. Otdel. Akad. Nauk SSSR —This is an investigation of the connection between the electrode potentials of Pb-Cd-Sb, Sn-Zn-Sb, and Sn-Cd alloys and the compn., a sudden potential change was observed in alloys contg. the compds. Zn-Sb and Sn-Sb. These sudden changes were produced with alloys forming compds. and with alloys which formed solid solns. with the compds. Microradiographic analysis confirms the conclusion that the potential change in the alloys investigated is due to the vari. of the components in the solns. and not to the presence of cryst. chem. compds.

Title: Thermal-Electric Properties of Cd-Sb Alloys

Original
Periodical: Zh. tekhn. fiziki, 1956, 26, No 4, 911-912

Abstract: A null method was used to measure the thermal-emf (α) of Cd-Sb alloys relative to Cu for concentrations of 0-100% Sb at junction temperatures of 10 to 100°. Two sharply pronounced maxima were obtained on the diagram of the α-composition of the alloy. One corresponds to the Cd Sb compound with $\alpha = 28.6$ mv/deg, and the second to Cd-Sb with $\alpha = 285$ mv/deg. For pure cadmium, $\alpha = 1.66$ and for antimony $\alpha = 30$ mv/deg. Based on these data it is assumed that the energy spectrum of CdSb has a structure that is usual for semiconductors, although for a final decision it is necessary to determine the temperature dependence of the electric conductivity.

PURPOSE: This book is intended for chemical and electrical engineers, physicists, metallurgists, and researchers interested in various aspects of electrochemistry.

COVERAGE: The book contains 127 of the 138 reports presented at the Fourth Conference on Electrochemistry sponsored by the Department of Physical Chemistry, and the Institute of Physical Chemistry, Academy of Sciences, USSR. The collection pertains to different branches of electrochemical kinetics, double layer theories and galvanic processes in metal electrodeposition and industrial electrolysis. Abridged discussions are given at the end of each division. The majority of reports not included here have been published in periodical literature. No personalities are mentioned. References are given at the end of most of the articles.

TITLE: Thermoelectric Properties of Sn-Cd and Pb-Cd Alloys

PERIODICAL: Fizika metallov i metallovedeniye, 1959, Vol 8, Nr 1,
pp 21-24 (USSR)

ABSTRACT: The thermoelectric properties of alloys have been widely
studied. This is due to the fact that they have great
practical and scientific importance. In practice, it is
often necessary to have materials which when put in
series with a given metal do not give rise to an
appreciable thermal e.m.f. From this point of view
it is important to carry out further studies on systems
in which the thermal e.m.f. curve has a point at which
the sign of the e.m.f. changes. The present work was
carried out in order to obtain the thermal e.m.f. curve
for Sn-Cd and Pb-Cd alloys as a function of the
concentration of the components. The effect of experi-
mental conditions on the thermal e.m.f. curve was also
investigated. The results obtained are shown in
Figs 1 and 2. Fig 1 shows the dependence of the
thermal e.m.f. for Sn-Cd alloys as a function of the
temperature difference between the hot and the cold

Card 1/2

Thermoelectric Properties of Sn-Cd and Pb-Cd Alloys

junctions for different compositions (indicated in the figure caption). Fig 2 shows the dependence of the thermal e.m.f. of Sn-Cd alloys on composition for different temperature differences (indicated in the figure caption). Figs 3 and 4 show analogous plots for Pb-Cd alloys. As can be seen, sign inversion occurs in all the graphs. The position of the inversion point on the Cd concentration axis changes with the temperature difference. As the latter increases, the inversion point is displaced towards smaller cadmium concentrations. There are 4 figures and 7 Soviet references.

TITLE: The Electrodic Potential of Cd-Sb(Elektrodnyye potentsialy splavov Cd-Sb)

PERIODICAL:

ABSTRACT: Explanations concerning the relationship between the electrode potential of alloys and their composition (Refs 1-4) are of special interest in investigations on the electro-chemical properties of metallic alloys. Thermal analyses of the system Cd-Sb showed that two compounds, Cd_3Sb_2 and CdSb (Ref 5) are present. Cd_3Sb_2 decomposes partially at lower temperatures (Ref 6) while CdSb is stable and can be used as a semi-conductor in rectifiers and amplifiers (Ref 7). The work of this paper utilized a GZB-47 ballistic galvanometer (Ref 8), a MYe-4 standard sample set as condensor, and a PPTV-1 galvanometer. 12 alloys with the following composi-tions were studied: 5.7, 6, 10, 30, 45, 48, 50, 52, 58, 65, and 80% Sb, and 1. n H_2SO_4-, HCl-, and NaOH solutions were

Card 1/2

The Electrodic Potential of Cd-Sb   SOV/76-33-2-24/45

used as electrolytes. The addition of Sb causes the
potential of the alloy to become more positive. The absolute
value of the potential is higher in the alkali solution
than in the acid solutions. 3 minima are indicated in the
potential-composition diagram (Fig). The minimum at 7.5% Sb
is considered to be a eutectic structure. The minimum at
52% Sb clearly represents the formation of the compound
CdSb. The potential minimum at 80% has still to be explained
by further investigations. Finally, M. A. Popova is thanked.
There are 1 figure and 10 Soviet references.

TEXT: The authors report an experimental study of the
physical properties of CuAl$_2$. This material is said to be
interesting because its components are typical metals and it is
used as the hardening base for many alloys. In the present work
the authors have measured its density, microhardness, linear
expansion, specific heat, electrical conductivity, and thermo-
electric power. The composition of the specimens was 54.09% Cu
and 45.91% Al. The density (measured by a hydrostatic method)
was found to be 3.98 g/cm^3 at 20 °C. The microhardness was
measured with the ПМТ-3 (PMT-3) apparatus using loads between
5 and 100 g. It was found that $H_{20} = 535.0$ kg/mm^2 and that
the formula
$$P = ad^n \qquad (1)$$

Card 1/3

Physical properties of CuAl$_2$

was satisfied to a high degree of accuracy [P is the load (kg),
d is the length of the diagonal of the impression (mm),
n = 1.77 and a = 99.0]. The linear expansion was measured with
a quartz dilatometer calibrated against spectroscopically pure
copper. The average expansion coefficient between 20 and 300 °C
was found to be 17.6 x 10^{-6} deg^{-1}. The specific heat was
measured by the method of cooling, as described by
Ya.Ya. Turovskiy and G.M. Bartenev (Ref.14: ZhTF, v.10, 1940, 514).
It was found that in the temperature range 50-300 °C the specific
heat at constant pressure (cal.g^{-1} deg^{-1}) is given by

$$c_p = 0.104 + 92 \cdot 10^{-4} \sqrt{t} \qquad (3)$$

where t is the temperature of the specimen in °C.
Fig.2 shows the resistivity (ohm.cm) as a function of temperature.
No explanation was found of the nonlinearity of this function.
Finally, the thermoelectric emf was measured as a function of
temperature and the result is shown in Fig.3, in which curve 1
refers to CuAl$_2$ and curve 2 to Al. CuAl$_2$ is a typical
paramagnetic. Comparison of the properties of Cu and Al shows

Card 2/4

Physical properties of CuAl$_2$ S/139/62/000/001/023/032
                                   E032/E114

that in many respects the properties of CuAl$_2$ are intermediate
between Cu and Al. The exceptions are the microhardness and
the resistivity, which are considerably higher than those for
Cu and Al.
There are 3 figures and 1 table.

TITLE: Physical properties of copper-antimony alloys

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Fizika,
             no. 2, 1962, 62 - 69

TEXT: The microhardness, thermal, electrical and thermo-
electric properties of Cu_3Sb-Cu_2Sb were investigated in the
range of copper contents between 61.02 and 50.07 wt.% and
antimony contents between 38.98 and 48.93 wt.%. Microhardness
measurements with a load of 20 g have shown that the Mayer
relations are obeyed with a satisfactory degree of accuracy.
The microhardness may be greatly affected by the displacement of
admixtures into the intercrystallite space and by the fact that
the intercrystallite substance in high-purity materials is in a
finely-disperse state. The microhardness of freshly cleaved
surfaces of Cu_2Sb single crystals was $H_{20} = 315$ kg.mm^{-2}. The
dependence of the coefficient of linear expansion $\alpha \cdot 10^{-6}$ deg^{-1}.

TITLE: Physical properties of Cu-Zn-Sb alloys

PERIODICAL: Fizika metallov i metallovedeniye, v.14, no.2, 1962,
             172-181

TEXT: The aims of the investigation were to ascertain the cause
of the embrittlement of copper-zinc alloys caused by antimony
additions and to study the properties of Cu-Zn-Sb alloys.   Alloys
of the pseudo-binary systems $CuZn_3-Zn_3Sb_2$, $Cu_5Zn_8-Zn_3Sb_2$ and
$CuZn-Zn_3Sb_2$ were studied.   Alloys of each system containing
10, 20, 30, 40, 50, 60, 70, 80 and 90% by weight of Zn_3Sb_2 were made by
melting the pure components in evacuated flasks of low melting-
point glass and placing the flask in a thick-walled steel crucible.
As the temperature was increased the glass softened and the alloys
were covered by a semi-liquid film of glass which protected them
from sublimation or oxidation.   The samples used for the tests
were held at 350°C for 200 hours, followed by furnace cooling.
The investigation involved the study of the microstructure,
microhardness tests and determinations of density, linear

Card 1/3

expansion, electrical and thermoelectric properties.
Metallographic analysis showed that the alloys of all three
systems were two-phase.   As would be expected from their higher
melting points, the primary solidification which occurred was of
the electron compounds.   There were some indications that there
was a very low mutual solubility of the components in the alloys.
The solubility of Zn_3Sb_2 in the β, γ and ε phases was less than 1%.
The microhardness tests, which were carried out with loads of
5 to 100 g gave values for the microhardness of pure Zn_3Sb_2
compound which were practically identical with those obtained for
Sn_3Sb_2 in brasses.   Density determinations gave values of
7.67 g/cm^3 for $CuZn_3$, 7.97 for Cu_5Zn_8, 8.14 for CuZn and 6.26 for
$ZnSb_3$.   The density of the alloys in all cases changed
continuously, but not linearly, with composition.   The variation
with composition of the linear expansion of the alloys was linear
with systems containing $CuZn_3$ and Cu_5Zn_8, but nonlinear for the
Cu-Zn system.   The resistivity at 20°C was 10.5 x 10^{-6} ohm per cm^3
for $CuZn_3$, 11.8 x 10^{-6} for Cu_5Zn_8 and 5.6 x 10^{-6} for CuZn, but the
value for Zn_3Sb_2 was considerably higher, being 1600 x 10^{-6} ohm/cm^3.

Physical properties of ...   S/126/62/014/002/003/018
                                               E114/E435

In the alloy systems, the rate of increase in resistance was
nonlinear with increase in Zn_3Sb_2 content.   The thermoelectric
properties were measured relative to copper and it was found that
the emf produced with Zn_3Sb_2 was opposite in sign to that produced
by the other compounds.   In all the alloy systems the thermal
emf increased nonlinearly with increase in Zn_3Sb_2 content of the
alloy.   From the metallographic examinations and microhardness
determinations it was shown that the embrittlement resulting
from antimony additions to brass is due to the compound Zn_3Sb_2,
in alloys containing more than 50% zinc.   There are 9 figures and
2 tables.

TITLE: Electrical and thermoelectrical properties of aluminum-zinc
alloys

SOURCE: Fizika metallov i metallovedeniye, v. 20, no. 4, 1965, 512-518.

TOPIC TAGS: thermoelectric property, electric property, aluminum
alloy, zinc alloy

ABSTRACT: The test samples were 80-85 mm long with a diameter of 3.5
mm. They were annealed for 120 hours at a temperature of $250 + 5°C$,
and cooled in the furnace. The samples contained from 10 to 100%
aluminum and 10 to 100% zinc. The resistance of the samples was mea-
sured by the conventional potentiometric method. The thermoelectric
motive force was measured with respect to copper. Measurements of the
magnetic susceptibility (Faraday method) were made on cylindrical sam-
ples with a height of $5 + 0.1$ mm. The sample was placed in a magnetic
field with an intensity of 10^4 oersteds. The magnetic susceptibility
was calculated by the formula:

$$x_1 = x_1 \frac{m_1}{m_1} \frac{F_1}{1}$$

(1)

where kappa$_1$, m$_1$, F$_1$ are the susceptibility, the mass, and the force
acting on the sample. The magnetic susceptibility of the samples was
calculated with respect to aluminum, for which kappa was taken as
. . . .
. . . . According . . . .
time data, aluminum's paramagnetic, and zinc diamagnetic. Therefore,
. . . . . . expected that, as a silver composition, the magnetic sus-
ceptibility would change sign. The experimental results are shown in
a figure, with an increase in the zinc content in the alloy, the mag-
netic susceptibility decreases monotonically, but, in the region of
. . . . there is a marked increase in each.
At high zinc concentrations, the magnetic susceptibility again de-
creases and, in alloys containing 80% zinc, is immeasurably small.
. . . . containing more than . . . is
negative. "The authors are deeply indebted to Š. I. Artyukhov for his
great help in the experiment." Orig. art. has: 6 figures and 1 table.

ABSTRACT: The authors describe how well the mining work of the block
             Nr. 34 of the Balousovo Mine was organized. The work was exe-
             cuted by a party of 12 men. This party executed all the mining
             work, the boring of blast holes and the maintenance of all
             mechanical appliances. There are 2 figures and 3 tables.

TITLE: A Loading and Transportation Aggregate (Pogruzochno-transportnyy agregat)

PERIODICAL: Mekhanizatsiya Trudoyemkikh i Tyazhelykh Rabot, 1958, # 3, pp 30-31 (USSR)

ABSTRACT: In order to speed up the transportation of rock and to raise labor efficiency, the engineers K.D. Volkov, B.M. Grudin and N.F. Baklitskiy of the Belousovskiy rudnik (Belousovo Mine) have designed a level-driving bunker train with a scraper conveyor of the type PML-5, which mechanizes completely the loading, transportation and unloading of excavated material.
       The basic parts of the aggregate are: the bunker train, the scraper crane, the loading device and the electric locomotive. The bunker train consists of 15 cars, holding capacity is 25 cu m and the length of the train is 31 m.
       There are 2 graphs.
